Health Maintenance - HPV Education and PHQ9

**HPV Education**
When there is no immunization documented in the EMR for male and female patients age 9 and older, the provider is notified to counsel the patient about the role of immunization in preventing HPV and cervical cancer.

The reminder stops displaying when the first HPV immunization is documented.

**PHQ9**
For patients 12 and older, this reminds providers to fill out a PHQ9 screening questionnaire.

The Health Maintenance item is completed when the score is documented in the Screening Tools powerform or when the paper questionnaire is scanned into the patient’s chart.

**Note:** If using Dynamic Documentation, and PHQ9 is documented in the Screening tools powerform, this information will pull into their dynamic documentation note under the medical history.
