ENFit® Conversion

Increasing safety by decreasing the possibility of enteral/IV misconnections

Background

As part of a global safety initiative, all health care suppliers are working on a new connection system for enteral supplies called ENFit.

What is ENFit®?

ENFit is a global standard connection system for enteral feeding sets, syringes, and feeding tubes designed to eliminate the possibility of tubing misconnection.

Why are we changing?

This was driven by an increasing number of incidents of patient harm, including death, which occurred after enteral meds or feedings were accidentally infused into PIVs, central lines, and even endotracheal tubes.

Examples of the new products:

Medication adapter

Feeding tube

Syringe

Extension Set
